# I. Introduction

---

This paper proposes a global blockchain-based higher education credit platform, named EduCTX based on the concept of the European Credit Transfer and Accumulation System.

In order to create a globally trusted higher education credit and grading system the proposed system aims to exploit the benefits of the blockchain, offering:

- security,
- anonymity,
- longevity,
- integrity,
- transparency,
- immutability
- global ecosystem simplification.

# I. Introduction

## A. Motivation

---

### **The majority of higher education institutions (HEIs):**

- keep their students' completed course records in proprietary formats;
- have their own specialized system for keeping students completed course records;
- do not share their students' data;
- store data records in different standards;
- sometimes do not give access to students to the online academic grading system.

Consolidated standards for the academic credit system like the ECTS, the adoption and implementation of a global decentralized, trusted, secure credit platform, is a challenge.

# I. Introduction

## B. Contribution

---

Blockchain-based decentralized higher education credit platform EduCTX:

- It builds on the distributed peer-to-peer (P2P) network system.
- These systems are flexible, secure and resilient.
- It transfers the higher education credit system from the analog and physical world into a globally efficient, simplified, ubiquitous version.
- The platform is the basis of EduCTX initiative, which envisions a unified, simplified and globally ubiquitous higher education credit and grading system.

## II. Related works

---

Blockchain is used in several domains:

- healthcare;
- government and business;
- logistics and transportation;
- Internet of Things (IoT);
- higher education.

# III. Background

## A. European credit transfer and accumulation system

---

The European Credit Transfer and Accumulation System (ECTS) is a framework for the higher education grading system developed by the European Commission and agreed to by the EU member states. The objective of this learner-centered system is to facilitate planning, delivery and evaluation of study programs as well as to facilitate student mobility by recognizing prior learning achievements, qualifications, experience and learning periods.

## C. Multisignature protocol

# IV. The proposed EduCTX platform

## IV. The proposed EduCTX platform

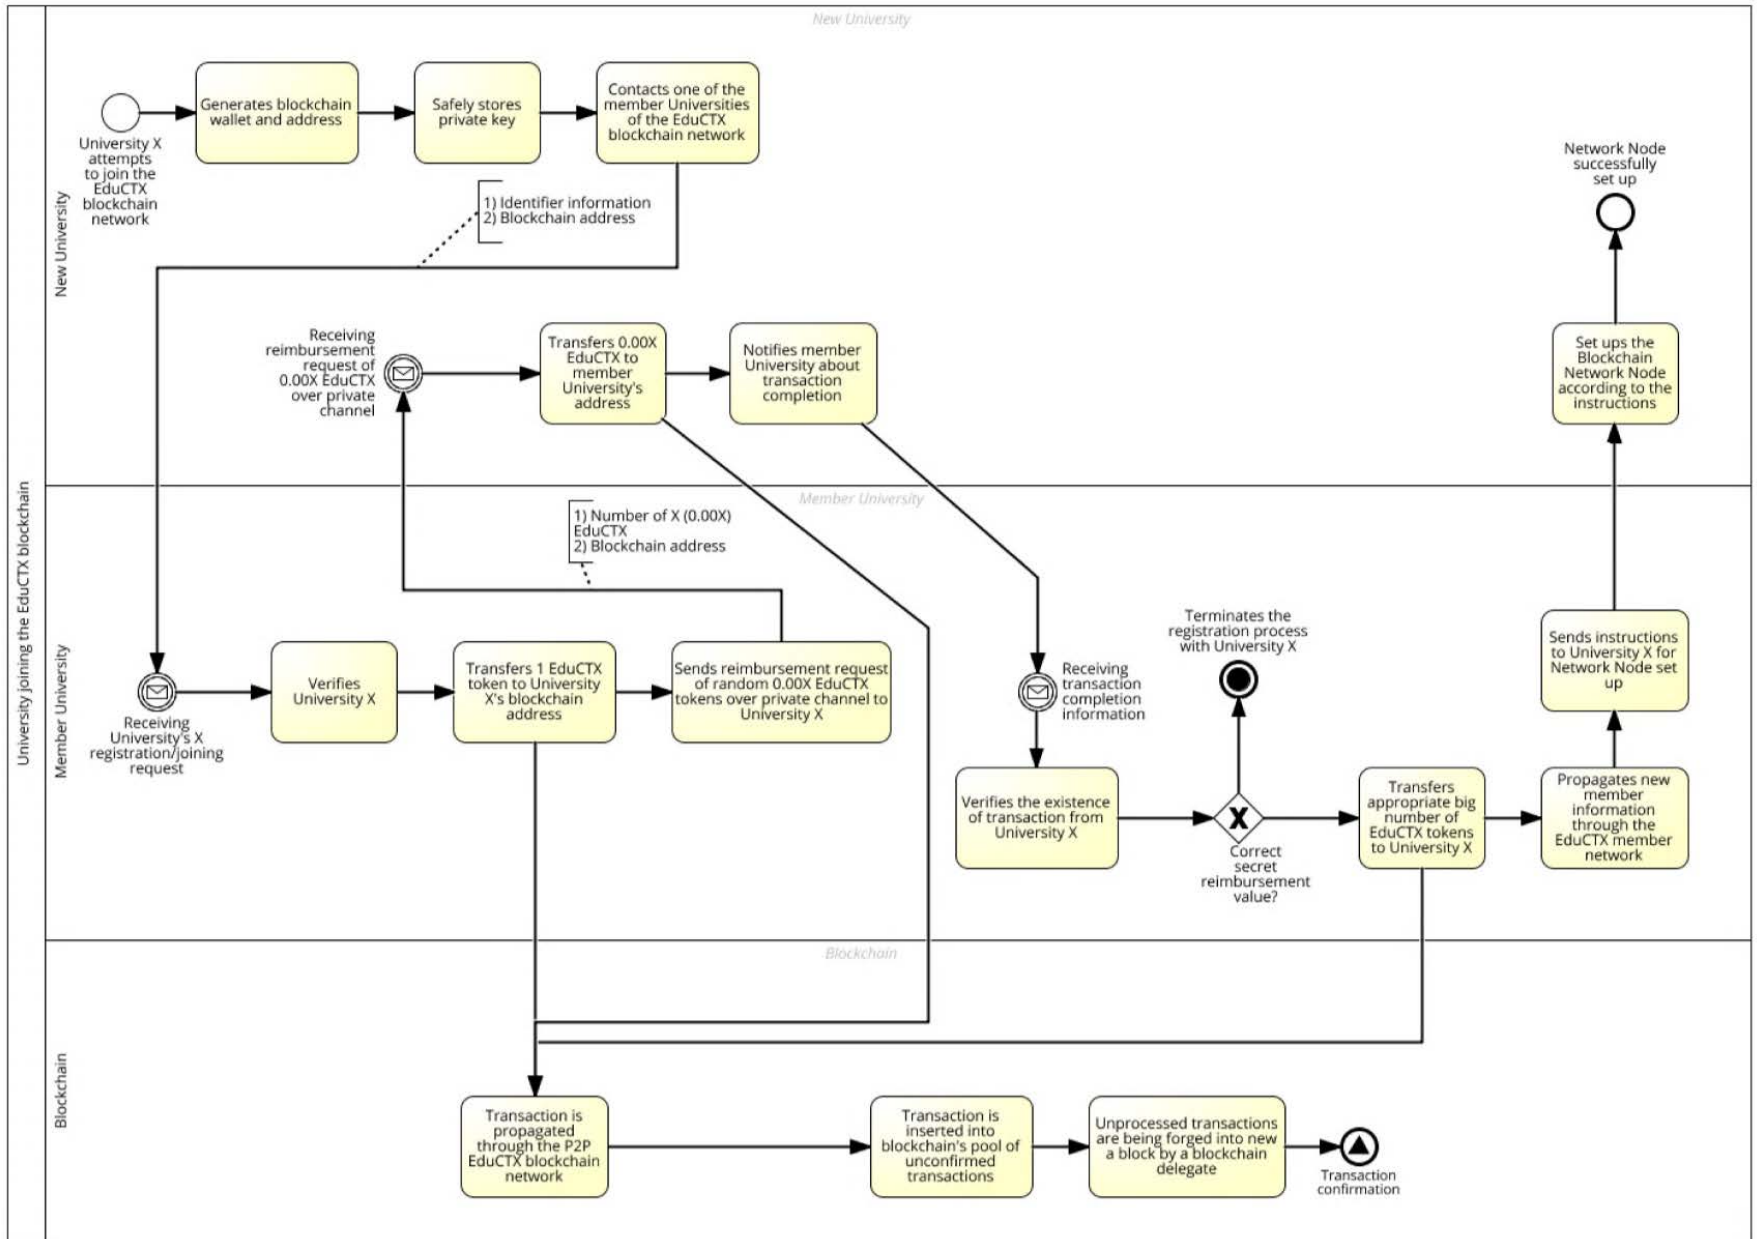

---

The transfer information is stored on the blockchain, where the following data is stored:

1. the sender is identified as the related HEI with its official name;
2. the receiver - student is anonymously presented;
3. token - course credit value;
4. course identification.

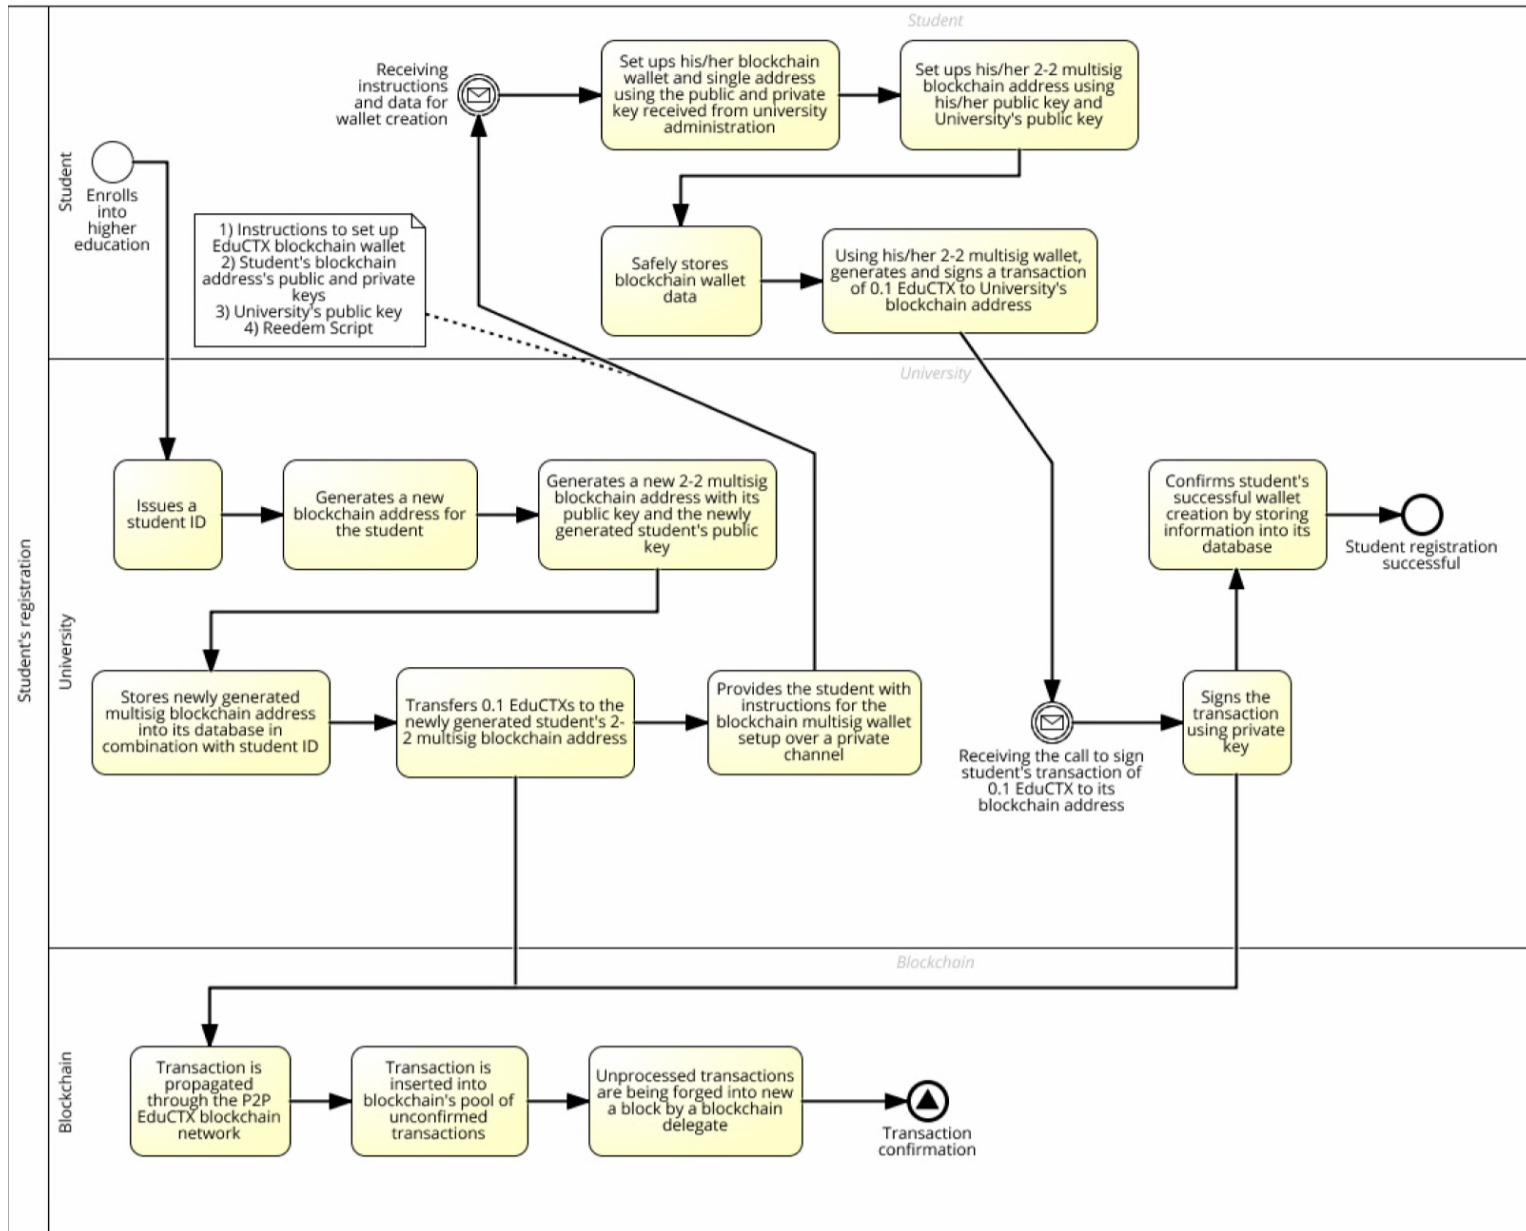

# IV. The proposed EduCTX platform

## V. Prototype implementation

---

As the underlying technology of EduCTX platform was selected the ARK Blockchain:

- a cryptocurrency;
- an ecosystem meant for blockchain mass adoption;
- flexible;
- open-source;
- available for a client API implementations;
- provides more than 12 different programming languages of client implementations.

# V. Prototype implementation

## A. EduCTX Ecosystem building blocks

### Delegated Proof of Stake

In **Delegated Proof of Stake**, the voting power is dedicated to determining who will fill the role of delegate, maintaining the network and validating transactions.

**1** Anyone who holds the blockchain base currency can vote for a validator.

**2** The validator with the most votes gets to become a delegate, validating transactions and collecting the rewards for doing so

# V. Prototype implementation

## A. EduCTX Ecosystem building blocks

---

In terms of the security and validity of the EduCTX records on the blockchain they defined several rules, to ensure the safety and validity of student course completion records:

- Every student is anonymous.
- Students cannot send received ECTX tokens to another address.

# V. Prototype implementation

## B. Joining EduCTX Ecosystem

---

- ❖ The EduCTX code is published on GitHub and licensed under the MIT License.
- ❖ It is designed in a modular manner.
- ❖ It can be seamlessly integrated with existing HEI's information systems.
- ❖ The blockchain end points are REST APIs that can be consumed by already published and available client APIs.
- ❖ The EduCTX platform can firstly co-exist with existing HEI information systems.

# V. Prototype implementation

## B. Joining EduCTX Ecosystem

Send ECTX from ER8dpx1Tt3tAeEwQV8TwxvVWE62a6AocMB✕

# V. Prototype implementation

## B. Joining EduCTX Ecosystem

---

In order to join the EduCTX ecosystem, the applying HEI has to provide a technical base and prove its identity. The basic steps include:

1. Preparing an EduCTX node;
2. Joining the EduCTX network;
3. Becoming a permissioned EduCTX member.

The EduCTX ecosystem has been designed to run efficiently, securely and non-invasively. Integration with existing information systems will be conducted based on their requirements by using the REST APIs.

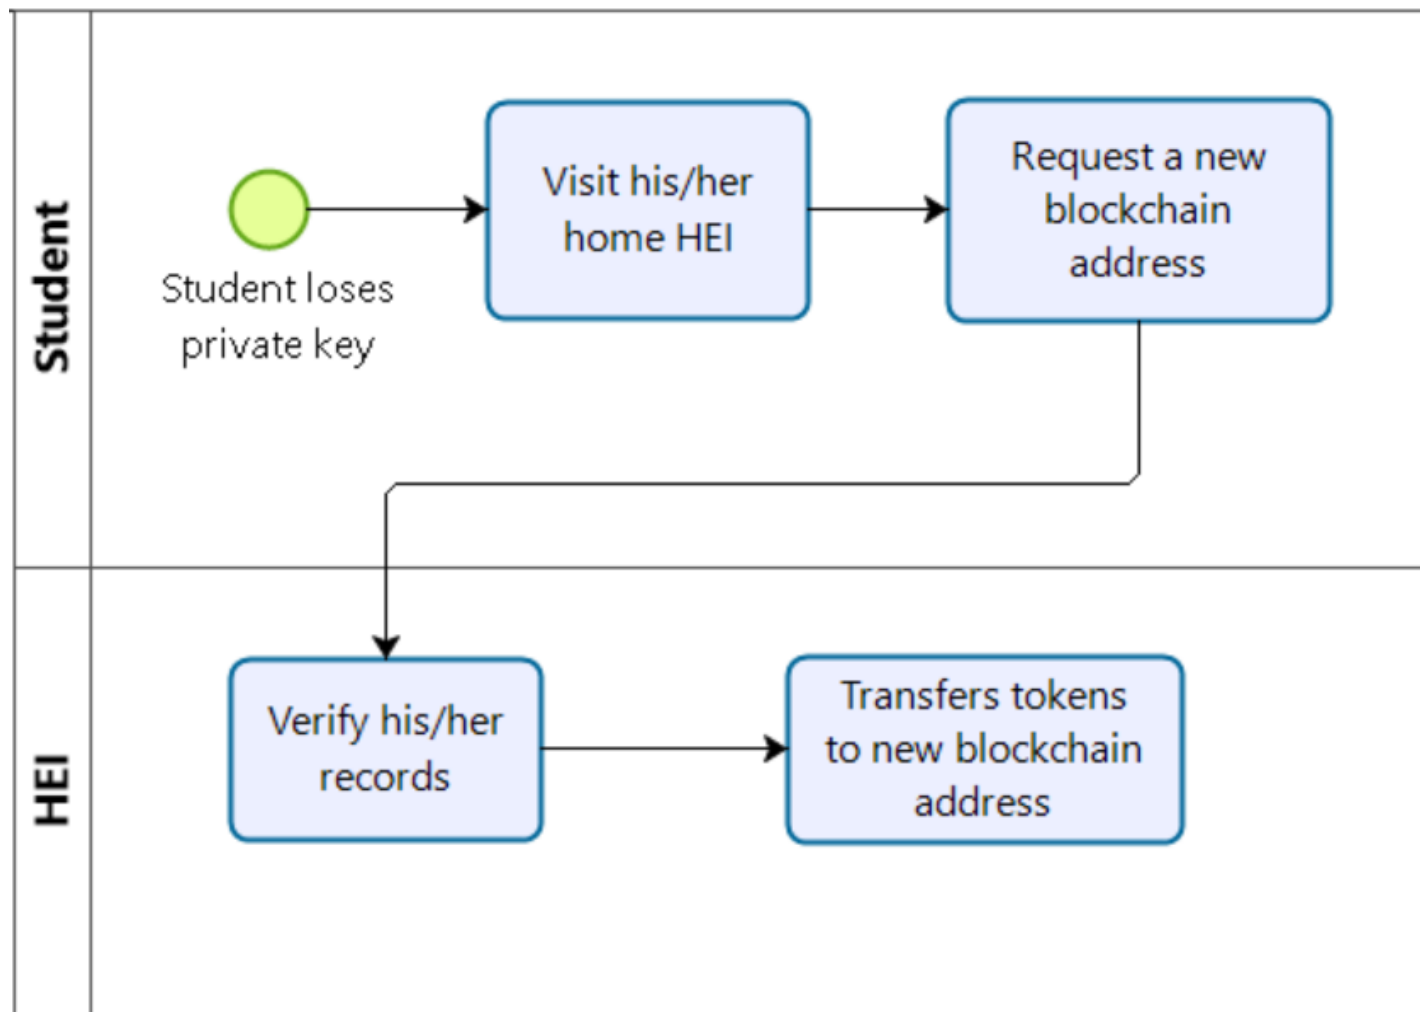

## VI. Discussion

---

There are several advantages for various stakeholders using a platform such as EduCTX:

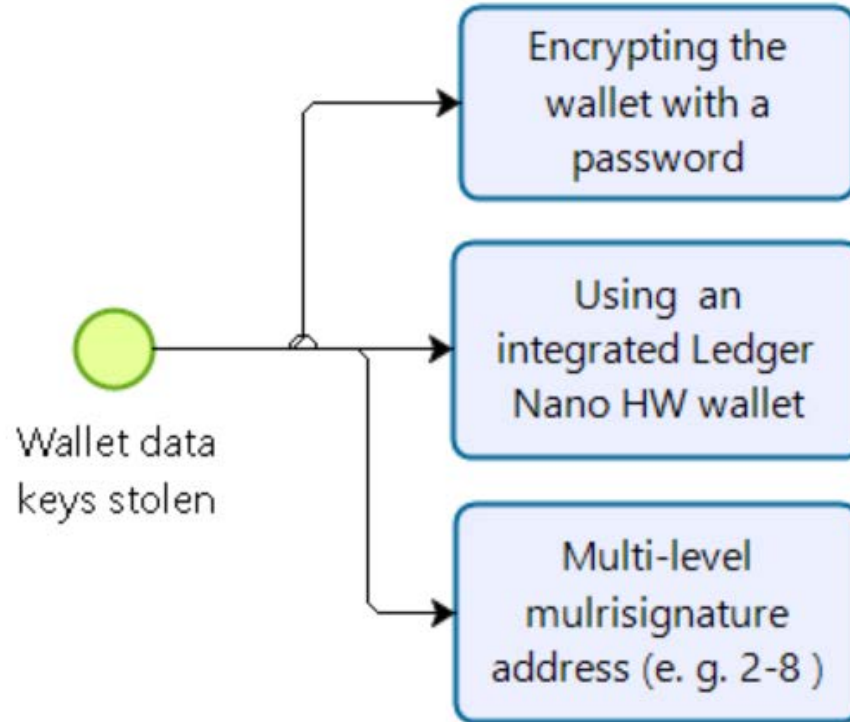

- ❖ It enables organizations the possibility of checking academic records of potential employees in a transparent way.
- ❖ HEIs get an open, decentralized and transparent way of validating records for students and their obligations.
- ❖ The proposed platform supports the HEIs in their activities related to students and provides the possibility of fraud detection and prevention.
- ❖ The students are offered the possibility of transparency and an overview of their academic obligations within the scope of their study programs.

# VI. Discussion

# VI. Discussion

---

## VII. Conclusion

---

- ❖ EduCTX was proposed as a global blockchain-based higher education credit platform. The proposed platform takes the advantage of the blockchain in order to create a globally trusted higher education credit and grading system.
- ❖ A prototype implementation of the EduCTX platform was presented which is based on the open-source Ark blockchain platform.

**Thank you**
